

Prototype 2

My second paper prototype focused on the desktop version of my project. I made the various modules on separate pieces of paper so that they can be moved around in a way that will mimic the actual project's drag-and-drop feature. The second picture demonstrates how the modules can be moved around as the category module is moved above the calendar. In the top picture, the to-do list is not expanded, but in the second picture, we can see how it looks when the arrow slides the module down to reveal all of the tasks, and the calendar moves out of the way. In a similar fashion, we can see the expanded version of the syllabus when the respective button is clicked on the Classes module. The Syllabus slides down and the various sections are present so that the user won't have to scroll through a PDF. All of the sections can be opened and closed and kept open if needed. This will all be accomplished through responsive design so that the page won't have to reload every time. The main feedback I received is to make a hover feature available so that the user understands the icons.
